

User Needs and Use Cases

I designed the Better World Books database to support the core operations of an online bookstore. The tasks I foresee a user handling with the database include creating customers, stocking in books, keeping track of the inventory of books, and managing orders. More simply, users will need the ability to add, view, update, and delete customers, books, orders and order items.

This database will also provide reporting capabilities. Several examples of this are:

- Analyzing sales and customer behavior for marketing purposes
 - o The reports will enable the user to determine which customers are the most valuable to the business based on the total amount of orders and how much money they've spent.
- Determine which books have been ordered the most and least for inventory purposes
 - o This information could lead to discounts on books that are not selling as well as others
