

Better World Books Database: Schema and Entity-Relationship Diagram

The Better World Books database is modeled as an online bookstore system with six core entities: Author, Category, Book, CustomerOrder, OrderItem, and Customer. A customer can place many orders, while each order belongs to one customer. Each order may contain multiple books, which is represented through the OrderItem entity. Each book is written by one author and belongs to one category, while an author and a category may each be associated with many books.

Better World Books ERD

Relation Schema

Author

(AuthorID **PK**, FirstName, LastName, Country, BirthYear)

Category

(CategoryID **PK**, CategoryName, Description)

Book
